Dear Mrs. McGinley:

The Comprehensive Environmental Response Compensation and Liability Act (CERCLA) of 1980 requires identification of hazardous substance inactive disposal sites. The National Contingency Plan, 40CFR300, also requires the reporting of inactive sites and the release into the environment of hazardous substances, including releases from inactive sites. To identify these sites and determine if releases are occurring, the Navy has developed the Navy Assessment and Control of Industrial Pollutants (NACIP) program. Under this program, the Texas Department of Water Resources was sent an Initial Assessment Study (IAS) for NWIRP, McGregor on 22 Aug 1983.

The IAS is the initial evaluation of potential sites for a more in depth Confirmation Study (CS) or remedial action. The IAS for NWIRP, McGregor identified 14 potentially contaminated sites of which 7 were recommended for a CS.

During February 1985, an area of asbestos disposal was found a few hundred feet from the previously identified asbestos pile in Area L. Because of this discovery, a CS is being conducted to determine the extent of contamination. After the CS, the site will be closed in a manner similar to that planned for the previously identified asbestos pile. By copy of this letter, EPA Region VI is notified of this change in the original IAS.

If any further information is needed, please advise.
